

# Testing Techniques

## Test Organization : TMap

Jan Tretmans

ESI  
Eindhoven, NL

Radboud University  
Nijmegen, NL

# TMap®: Test Management approach

- ➡ Approach to organization and structuring of testing
- ➡ Developed and promoted by IQUIP Informatica B.V. (NL)  
- now Sogeti - and others
- ➡ Mainly applied to administrative software testing
- ➡ Testing as a process - in addition to development process

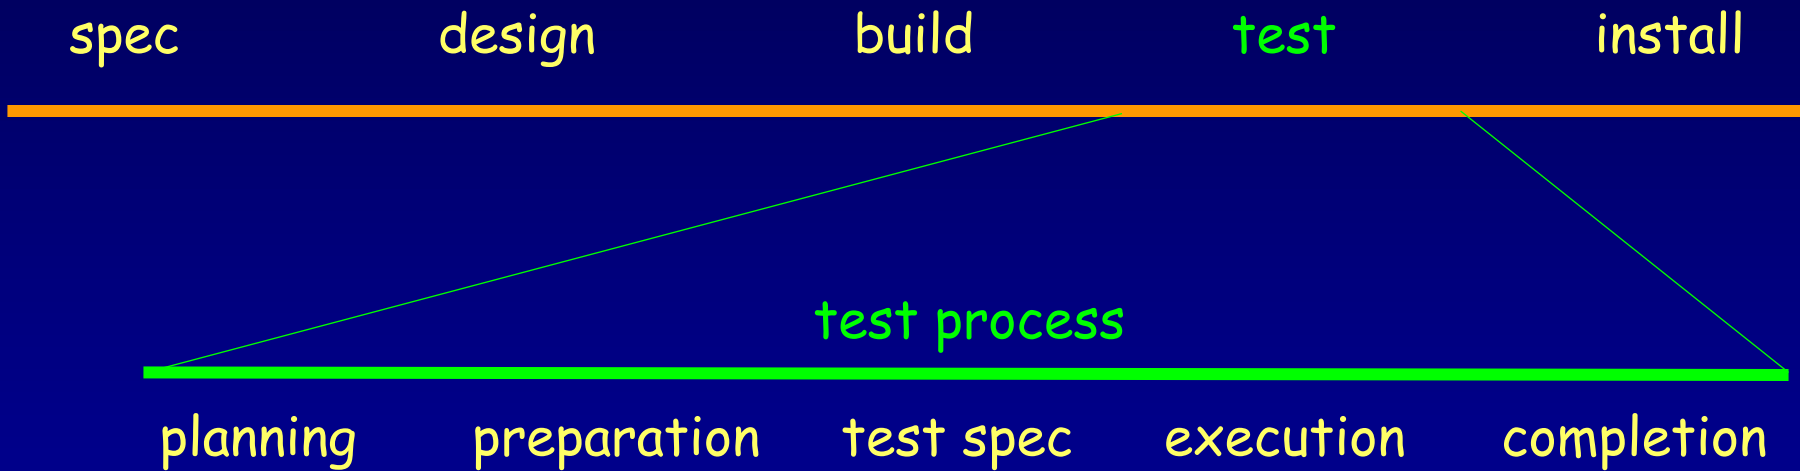

L : Life-cycle for testing

O : Organization

I : Infrastructure and tools

T : Techniques

# The Software Development Trajectory

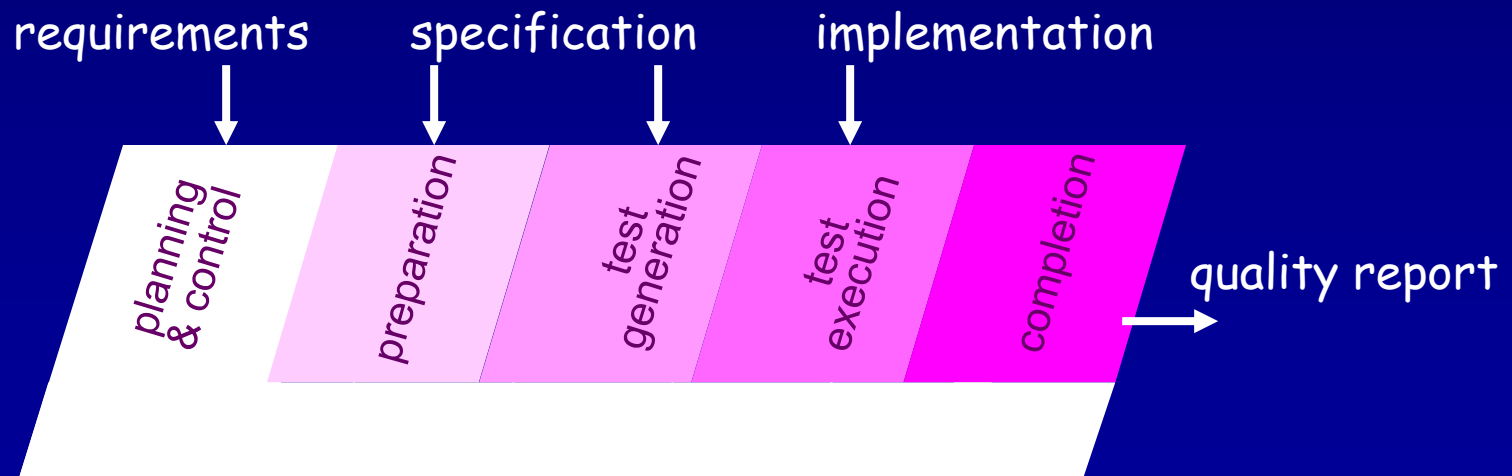

# Life Cycle : Testing as a Process

Testing as a process itself

- ◆ with its own phases
- ◆ in parallel with development process

# Testing in the Development Trajectory

spec

design

build

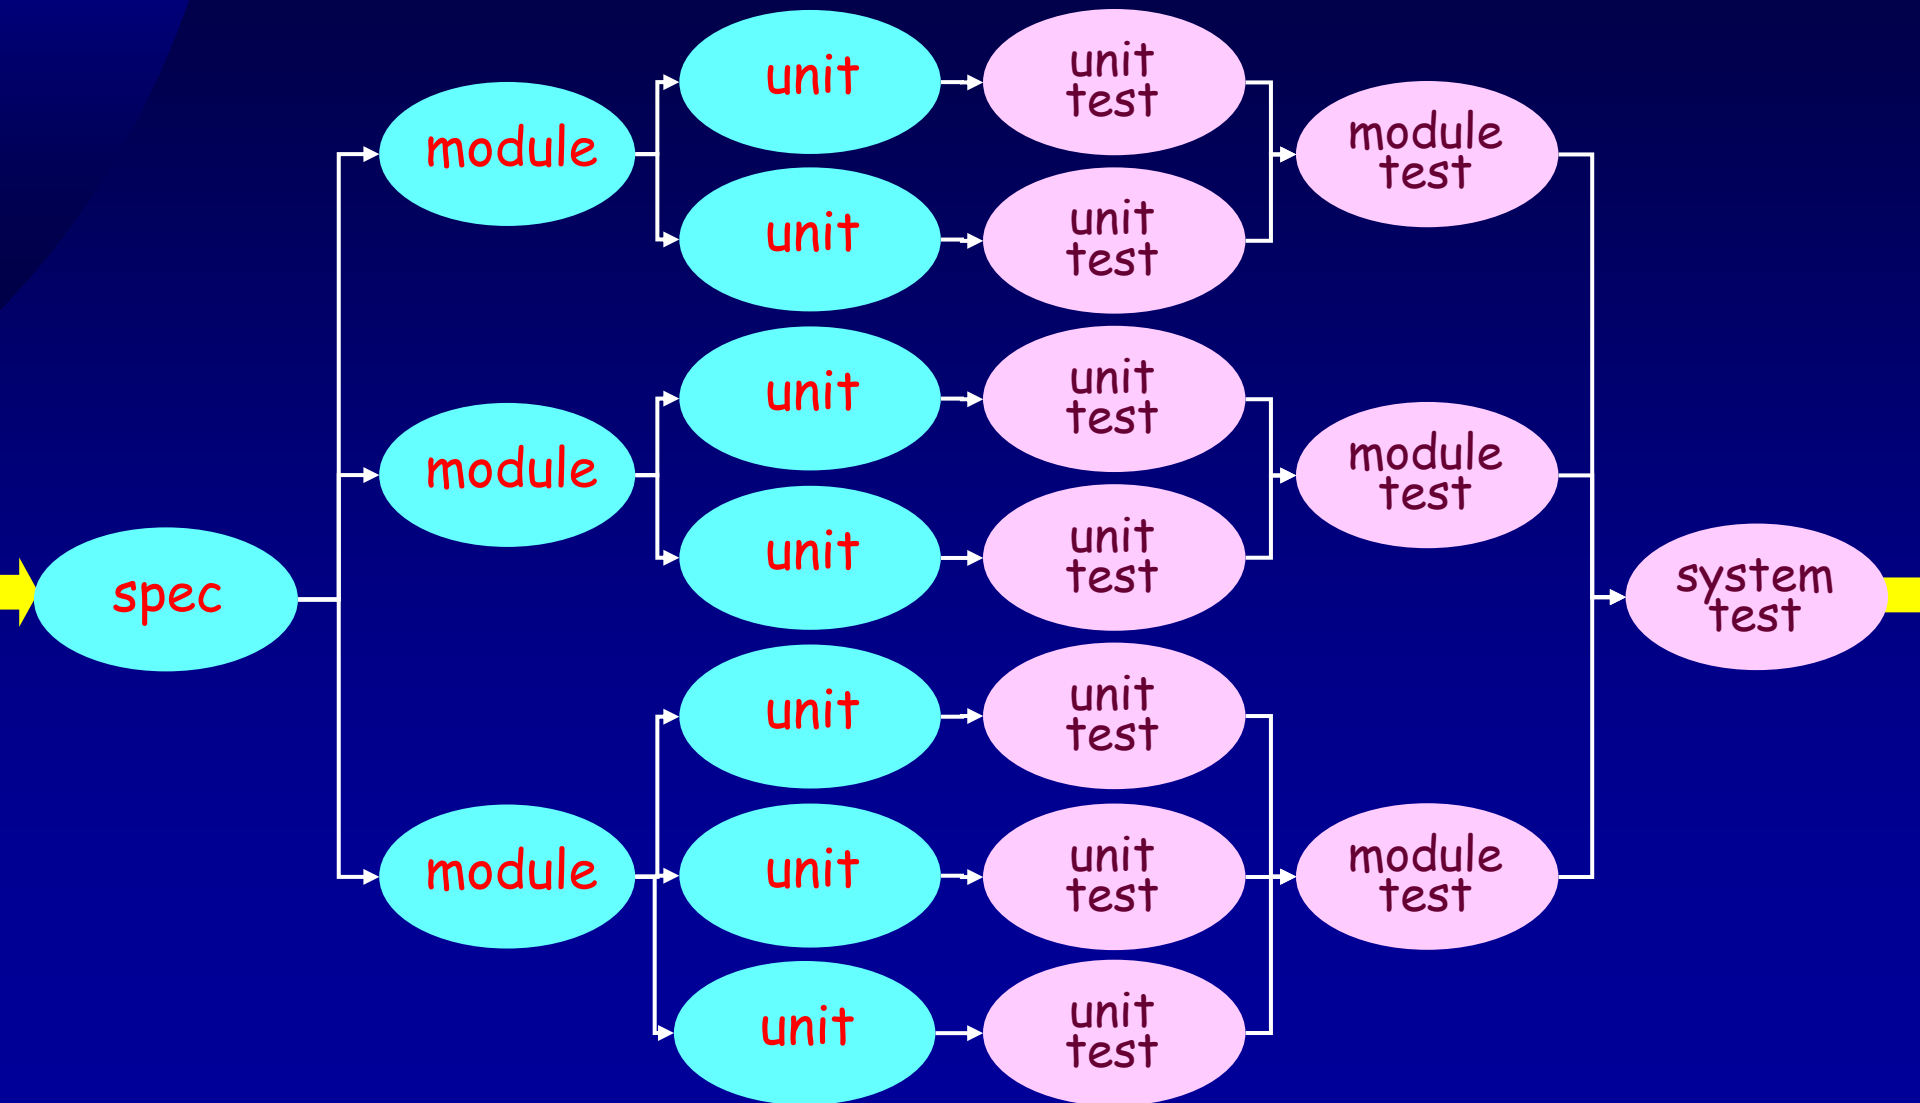

install

# Phase 1: Test Planning and Control

- ☞ Start at requirements phase of system development
- ☞ Development of master test plan and derived test plans
- ☞ Under responsibility of test manager
- ☞ Description of
  - ◆ what: objectives, tasks, deliverables
  - ◆ by whom: personnel, responsibilities
  - ◆ with what: infrastructure
  - ◆ in which time: planning
- ☞ Risk assessment : what and how thoroughly to test
- ☞ Control and management during remaining phases

# Integration and Test Planning

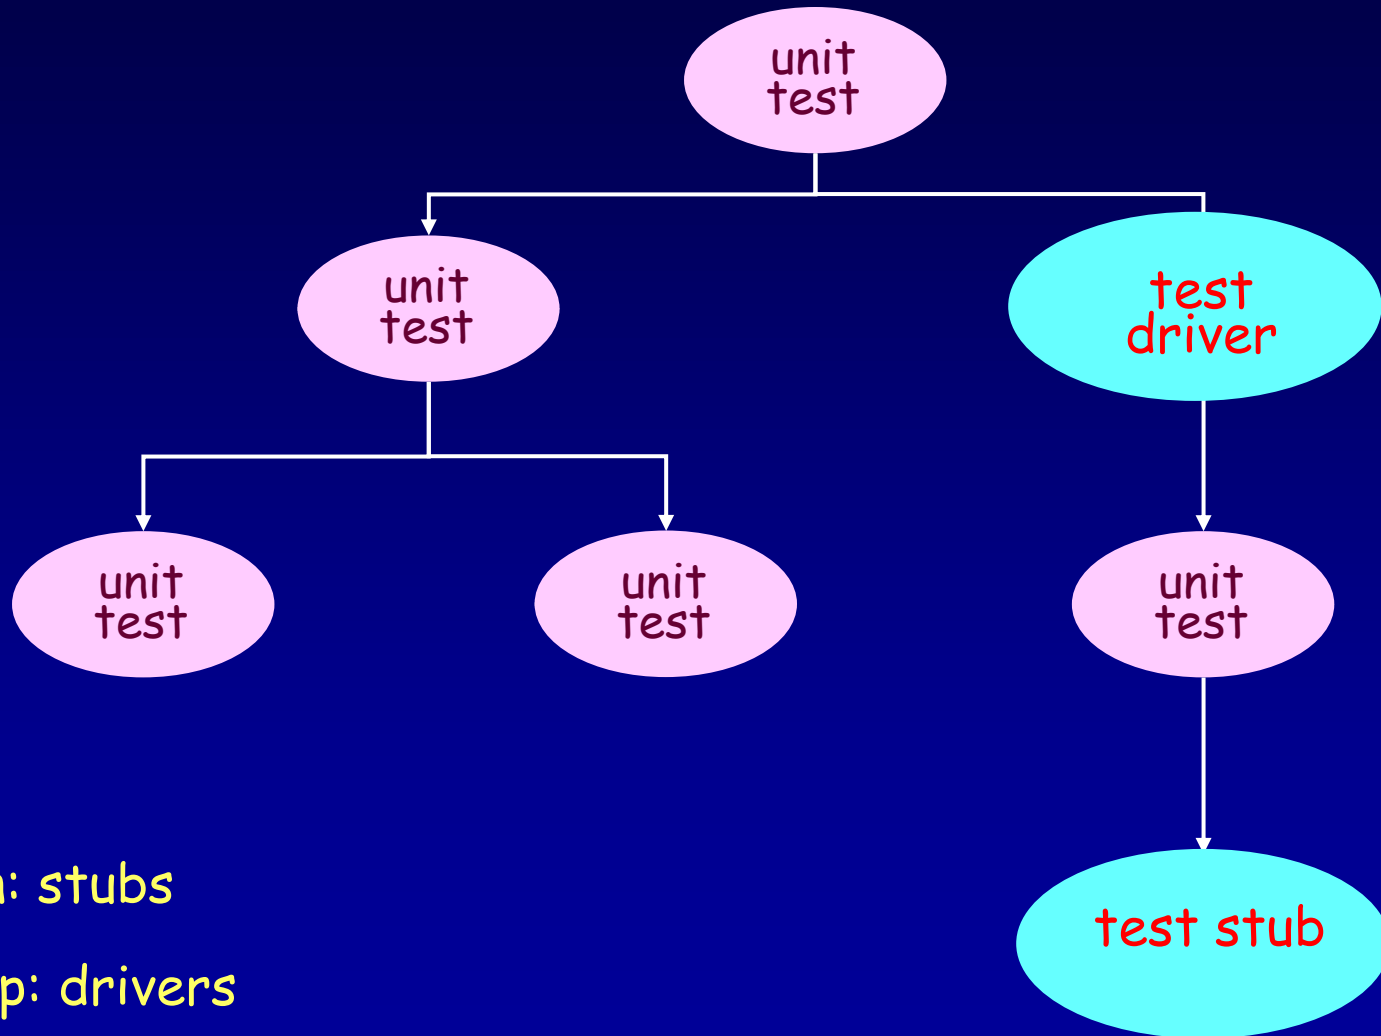

# Modules using Each Other

# Module Testing: Drivers and Stubs

# Phase 1: Test Strategy-- Plan

## Test Mission/Vision

- ◆ global, politically oriented, goal of testing for company

## Test Strategy

- ◆ high level test approach for company, department
- ◆ which levels of testing, techniques for testing, .....
- ◆ For:
  - external communication: what is testing, business, IT, auditors
  - intro to new team members
  - internal communication: shared common understanding

## Test Approach

- ◆ implementation of test strategy for project
- ◆ risk assessment, test projects goals, starting points for testing, ...

## Test Plan

- ◆ implementation of test approach:  
who is doing what and when, with what, what costs, .....

# Phase 2: Preparation

- ☞ Study of test basis
  - = specification and other documentation as basis for testing
- ☞ Reviewing of specifications
- ☞ Check of testability of specifications
- ☞ Specifications under formal change and configuration control
- ☞ Division of system into sub-systems which will be separately delivered and tested

# Phase 3: Test Generation (Specification)

- ☞ Generation and specification of test cases
- ☞ Test case ( = logical test case design = abstract test case ) :
  - ◆ purpose
  - ◆ starting situation
  - ◆ input and changes to be performed
  - ◆ expected output
  - ◆ expected resulting situation
- ☞ Development of infrastructure for test execution
- ☞ Implementation of test cases on infrastructure  
( = physical test case design = test scripts = executable tests )

# Phase 4: Test Execution

- ☞ Starts when testable code components are available
- ☞ Testing in phases:
  - ◆ static "tests" = (completeness) checks
  - ◆ basic functionality tests (pre-tests)
  - ◆ full functional testing
- ☞ Test execution:
  - ◆ Test
  - ◆ Repair
  - ◆ Re-test
- ☞ Discrepancy between actual and expected result:
  - ◆ defect in implementation
  - ◆ ambiguity in specification
  - ◆ invalid test case
  - ◆ error in test infrastructure
- ☞ Reporting about testing and quality
  - ◆ defects found
  - ◆ what has been / needs to be tested
  - ◆ trends

# Phase 5: Completion

- ☞ Final reporting : remaining risks
- ☞ Preservation of **testware**
  - ◆ reuse during regression / maintenance testing
- ☞ Evaluation
- ☞ After completion:
  - ◆ defects found by users
  - ◆ continuous testing, management and control
  - ◆ keep consistency between different configurations of specifications, implementations and testware

# Techniques

Standardized / known techniques:

- ◆ standard and known way of working
- ◆ allows checking by management / auditors
- ◆ reproducibility

☞ Templates

☞ Checklists

☞ Test generation techniques -

derive test cases from specification / test basis :

- ◆ equivalence partitioning, boundary value analysis, decision trees, . . .

# Infrastructure and Tools

## Test environment

- ◆ laboratory environment
- ◆ production environment

☞ Tools - classified according to life-cycle phase that is supported :

- ◆ **Planning and control** : standard planning and tracking tools, configuration management, traceability, defect administration and tracking, ...
- ◆ **Test specification** : editor, spreadsheet, load generation, ...
- ◆ **Test execution** : load generation, capture & playback, "diff", test (code) coverage, monitor, ...
- ◆ **Completion** : reporting tools

# Configuration Management

☞ About the items that constitute the system and building it

- ◆ source code
  - delivered systems
- ◆ object code
  - parameters
- ◆ third party software
  - documentation
- ◆ hardware
  - test environments
- ◆ compilers
  - test scripts
- ◆ build scripts
  - test results

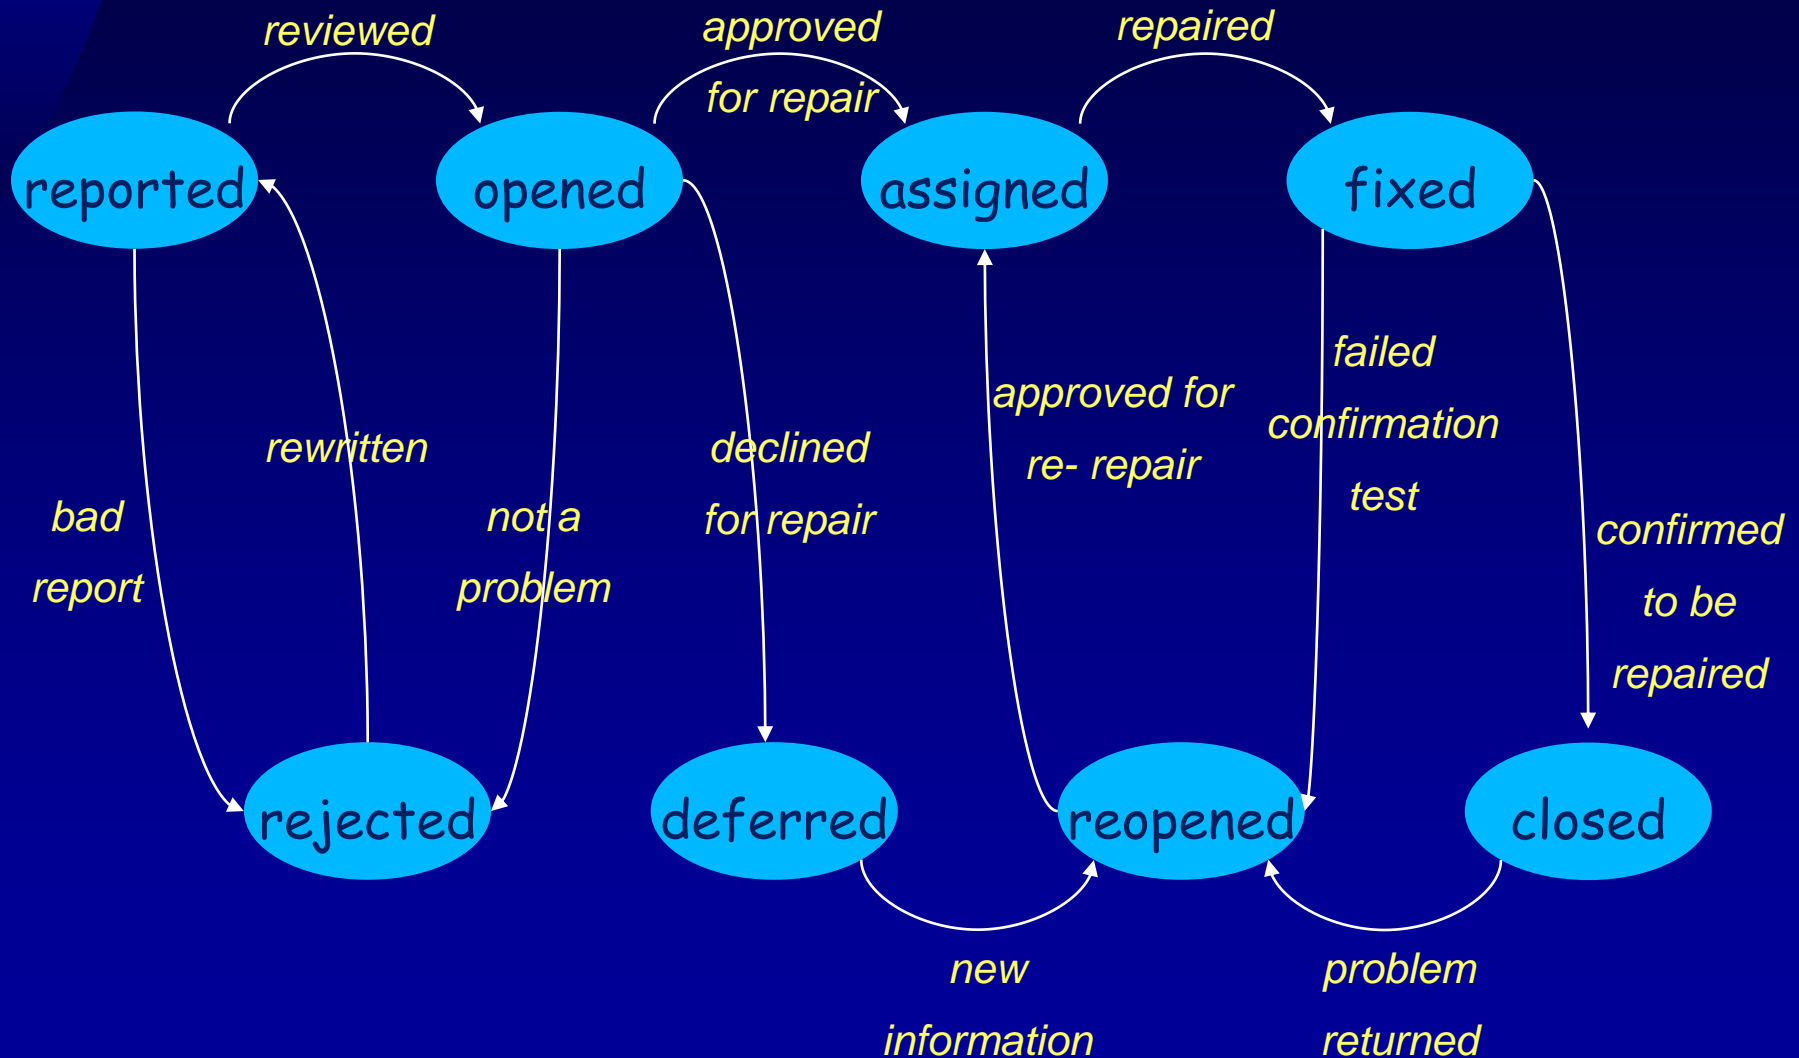

☞ All versions of these items

☞ Management of these items throughout project and system life cycle

☞ Testing:

- ◆ manage testware in same configuration management system,
- ◆ test proper versions
- ◆ test cases attached to proper versions
- ◆ defect reports attached to proper versions
- ◆ interface to development process

# Incident Life Cycle

# Organization

Organization of test process itself:

- ◆ control of resources
- ◆ availability of tools
- ◆ people
- ◆ education and competences

## ☞ Embedding in project

- ◆ independent test team
- ◆ status of test manager

## ☞ Embedding in organization

- ◆ separate test department
- ◆ test support department
- ◆ relation to quality assurance and auditing
