Final program

Variability mechanisms: a broad categorization

Variability at *compile time*

- ▶ *Goal*: only compile the source code required for current product
 - ▶ Smaller, optimised variants
 - ▶ Source code selected, compiled and packaged appropriately
- ▶ How to implement options or alternatives?
- ▶ For now: simple means for a few variants

Version control systems

Version control systems

- ▶ Support versioning of (typically source-code) files
 - ▶ Collaborative development
 - ▶ Archive of old file versions
 - ▶ Time stamps and user (author) names
 - ▶ Changes typically stored as delta
 - ▶ Process: Checkout – Change – Commit – Update – Change – Commit - ...
- ▶ Example systems: Git, Mercurial, SVN , CVS, Perforce, Visual SourceSafe, SCCS
- ▶ Here used as a configuration management tool

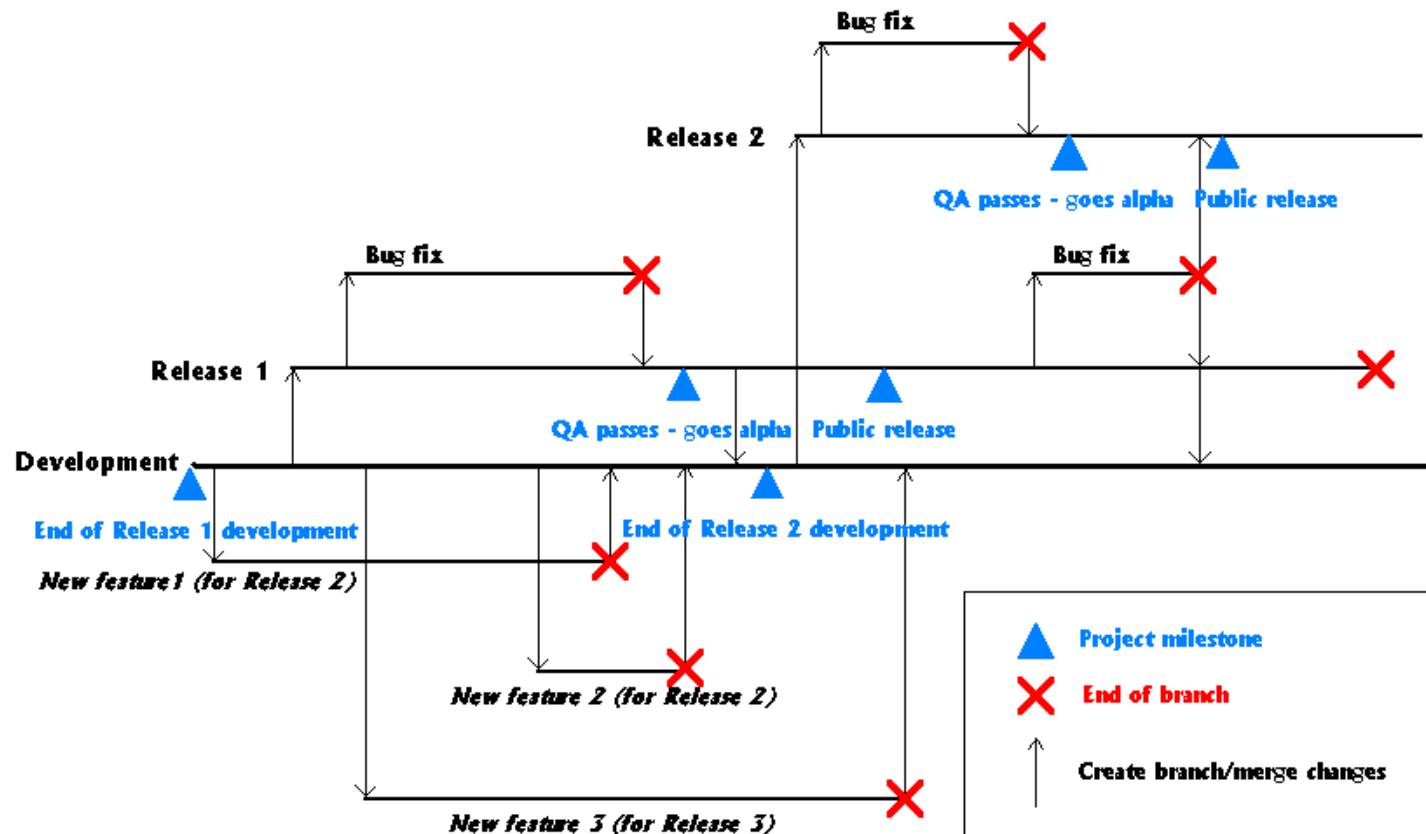

Code and non-code files

- ▶ Java code
- ▶ Documentation
- ▶ Models
- ▶ Build scripts: ant/makefile
- ▶ Licences
- ▶ Grammars
- ▶ HTML, JavaScript, CSS
- ▶ *Compiled binary files*
 - ▶ *Differencing, conflict management and merging more difficult*

Branching & Merging

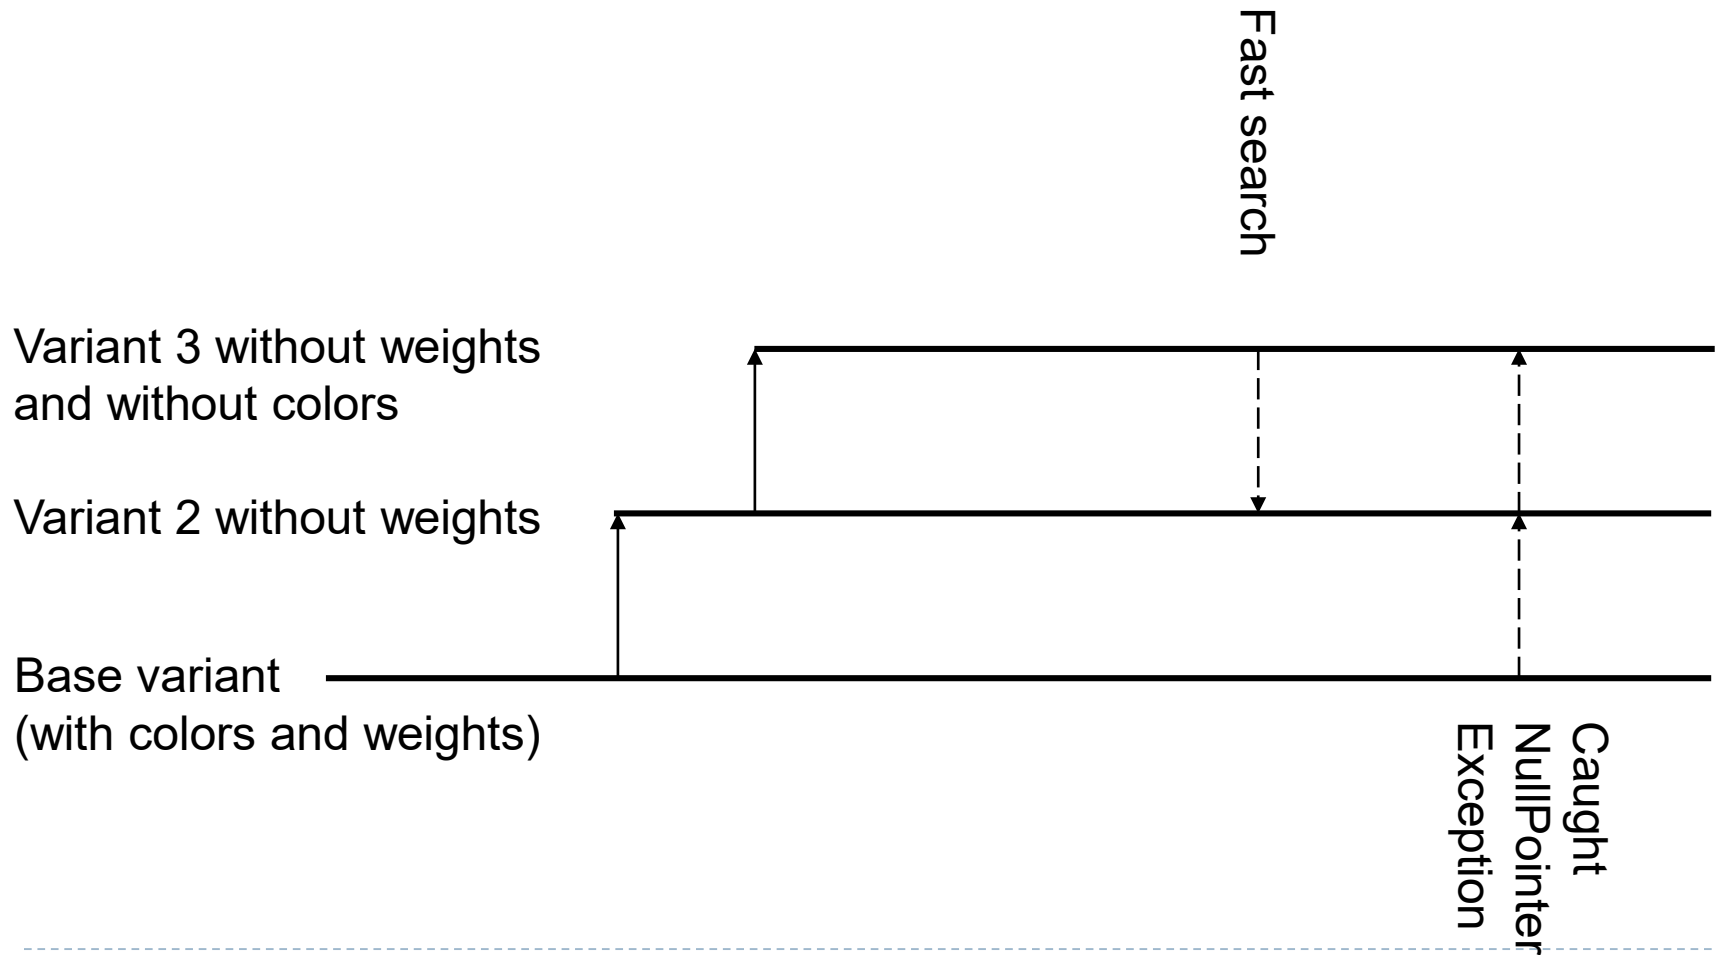

Release planning (Common case)

Branching and merging during development and releases

Release planning: Graph library

Alternative release plannings: Customer-specific

Customer-specific variations: a branch per customer

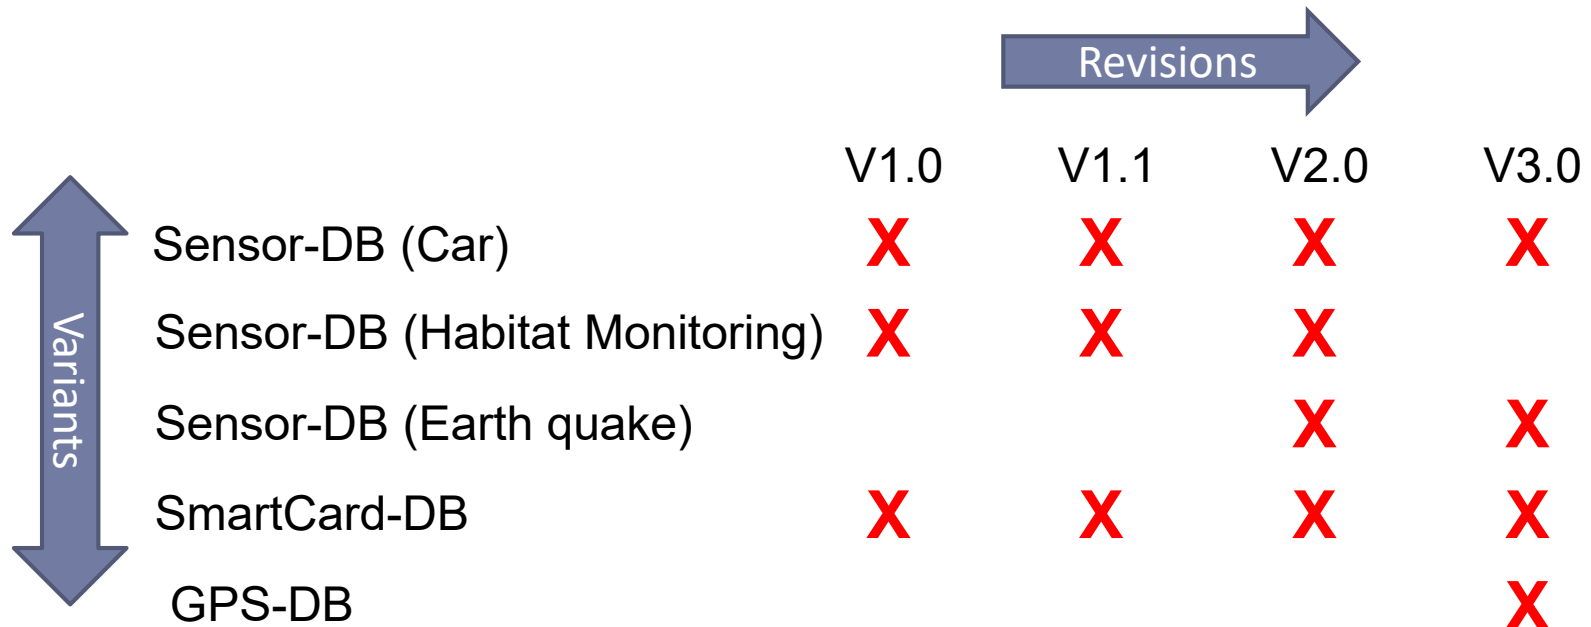

Alternative release plannings: Feature-oriented

Feature-oriented variations: a branch per feature

Variants vs. Revisions vs. Versions

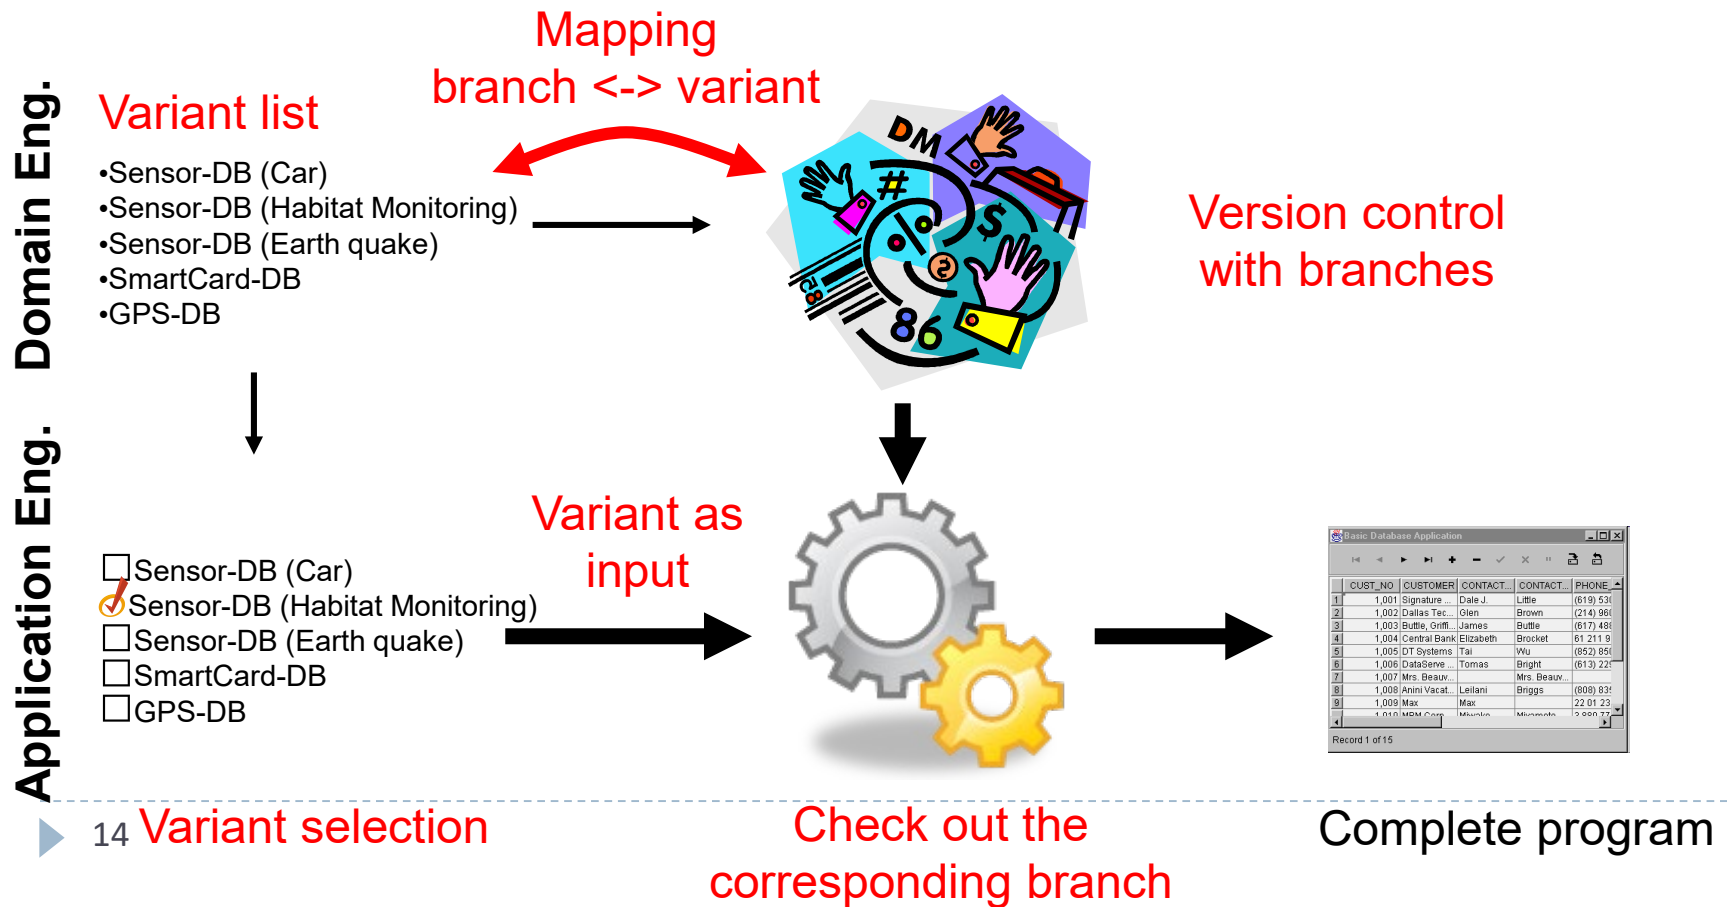

- ▶ **Revisions:** snapshots at a particular point *in time*, with identifier and (optionally) description; ordered.
- ▶ **Variants:** versions of the same artifact existing in parallel; coexist in space, usually not ordered.
- ▶ **Version:** umbrella term for revisions and variants

	V1.0	V1.1	V2.0	V3.0
Sensor-DB (Car)	X	X	X	X
Sensor-DB (Habitat Monitoring)	X	X	X	
Sensor-DB (Earth quake)			X	X
SmartCard-DB	X	X	X	X
GPS-DB				X

Product lines with version control systems

- ▶ Development of variants in branches
- ▶ On changes, might need to synchronize between branches

Product lines with version control systems:

Discussion

▶ Benefits

- ▶ Established, reliable systems
- ▶ Familiar process
- ▶ Good tool integration
- ▶ Language-independent (non-code files supported)

▶ Drawbacks

- ▶ Developing variants instead of features: flexible combination of features not directly possible
- ▶ No structured reuse (clone & own)
- ▶ High maintenance effort (bugfixes have to be propagated between branches)
- ▶ Tool support is largely text-based instead of language-based, often wrong level of abstraction

Build systems

Build systems

- ▶ Automation of build process
 - ▶ Copy files, clean directories
 - ▶ Call compiler and additional tools (e.g., JavaDoc generator)
 - ▶ Launch the tests
- ▶ Multiple steps, with dependencies/conditions
- ▶ Tools: make, ant, maven, gradle, ...

```
1 #!/bin/bash -e
2
3 rm *.class
4 javac Graph.java Edge.java Node.java \
5     Color.java
6 jar cvf graph.jar *.class
```

Graph library: simple build script

Professional build systems

- ▶ Make, Ant, Maven, Gradle...
 - ▶ Multiple build targets
 - ▶ Automated dependency resolution
 - ▶ Incremental builds for performance optimization
 - ▶ Preparing a build report
 - ▶ Reduction of specification effort by conventions
(Maven: standard structure for projects and configurations)
- ▶ Decide what is compiled when and where
 - ▶ Candidate for compile time variability
 - ▶ Multiple solutions possible

Solution 1: build script + config options

```
1 #!/bin/bash -e
2
3 if test "$1" = "--withColor"; then
4     cp Edge_withColor.java Edge.java
5     cp Node_withColor.java Node.java
6 else
7     cp Edge_withoutColor.java Edge.java
8     cp Node_withoutColor.java Node.java
9 fi
10
11 rm *.class
12 javac Graph.java Edge.java Node.java
13 if test "$1" = "--withColor"; then
14     javac Color.java
15 fi
16
17 jar cvf graph.jar *.class
```

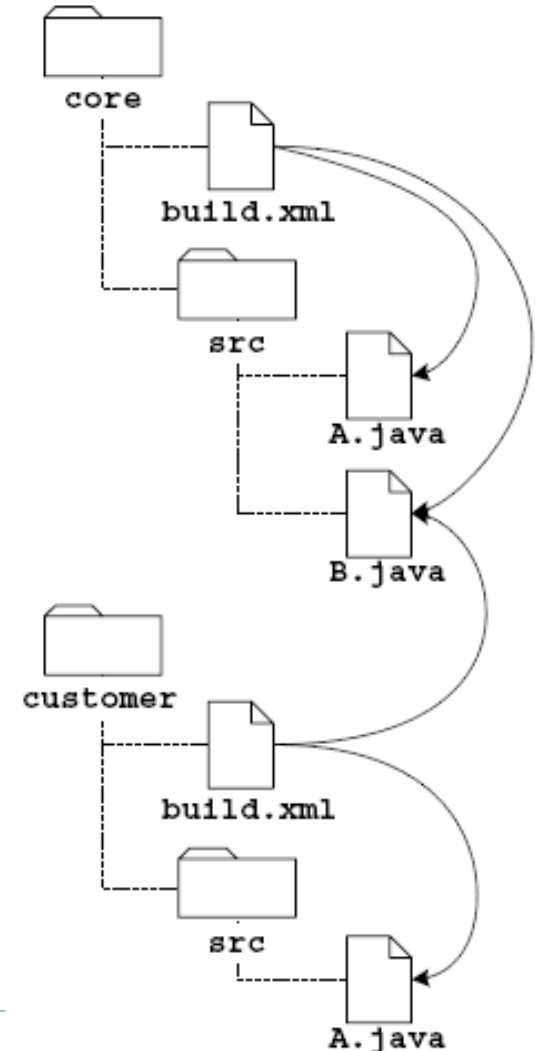

Config options here
as command line
parameters.

Alternative:
Config file

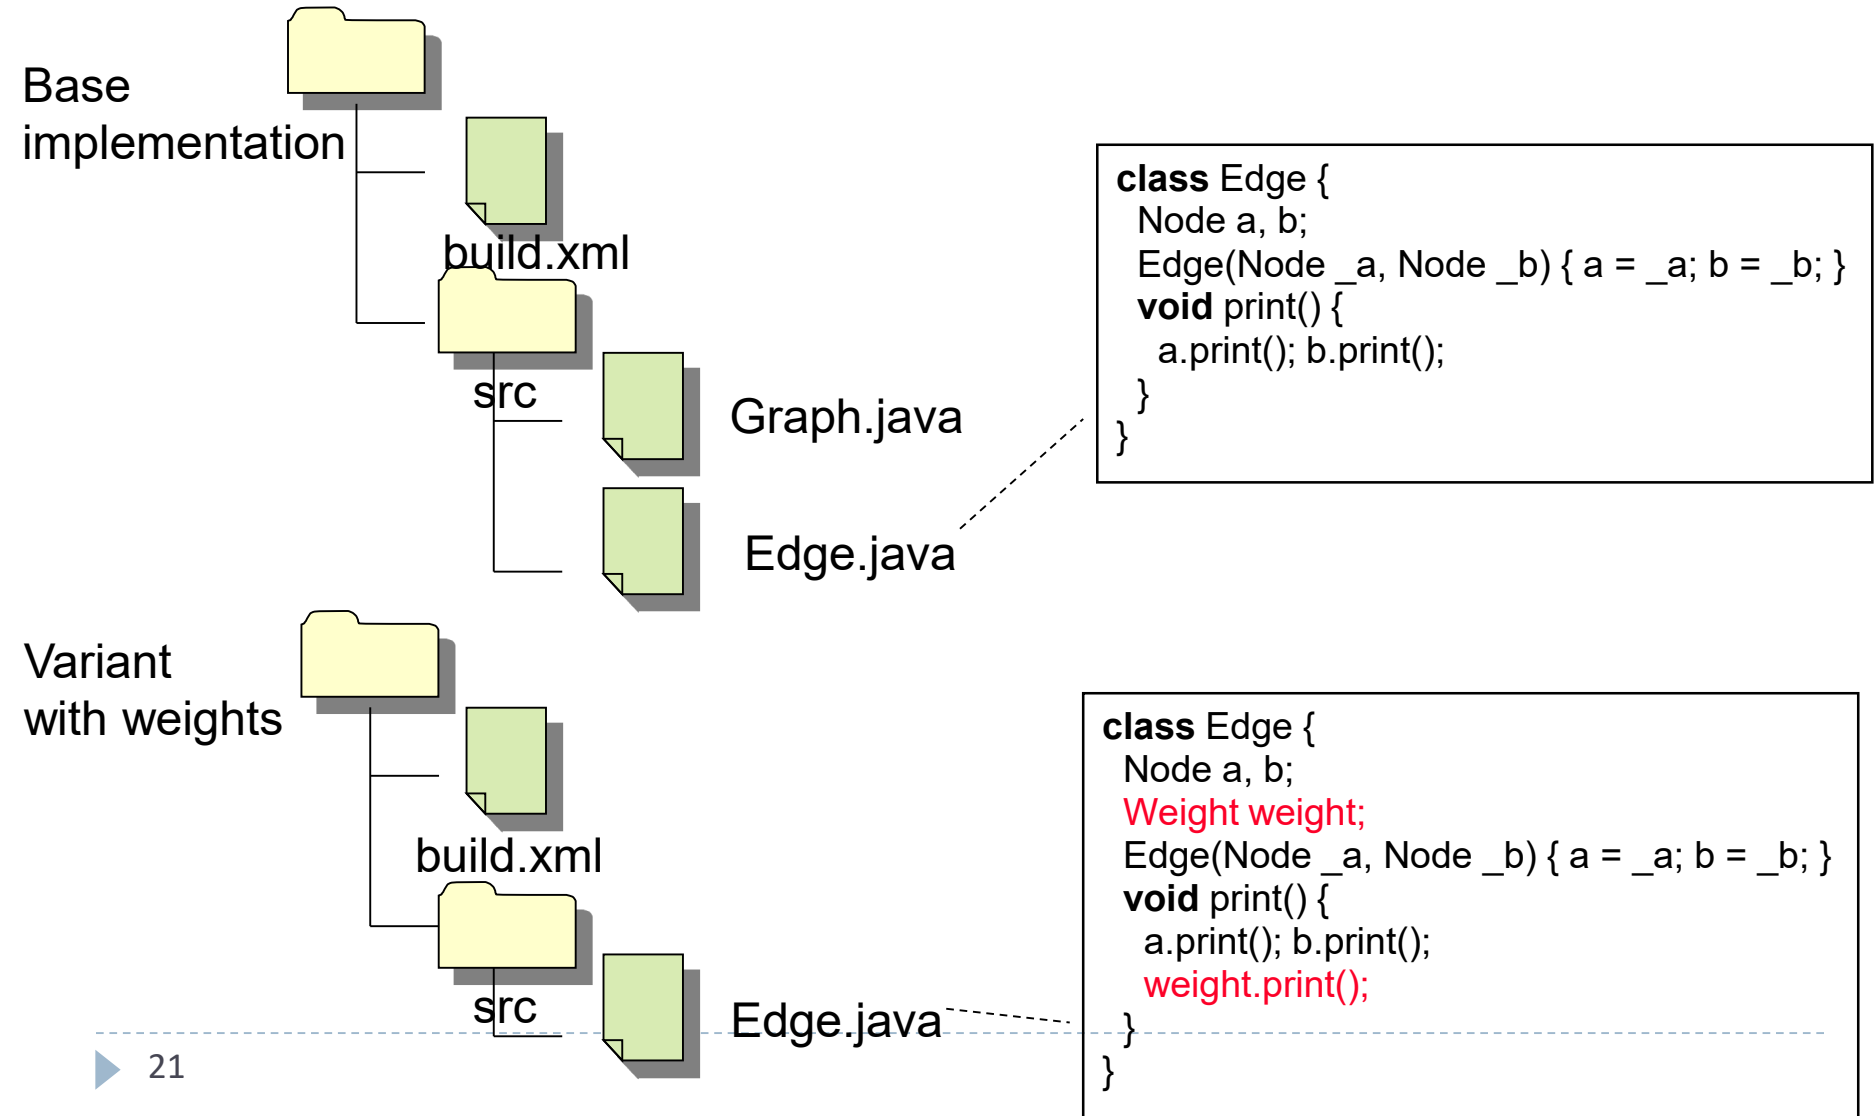

Graph library: build file enriched with variability

Solution 2: product lines with build systems

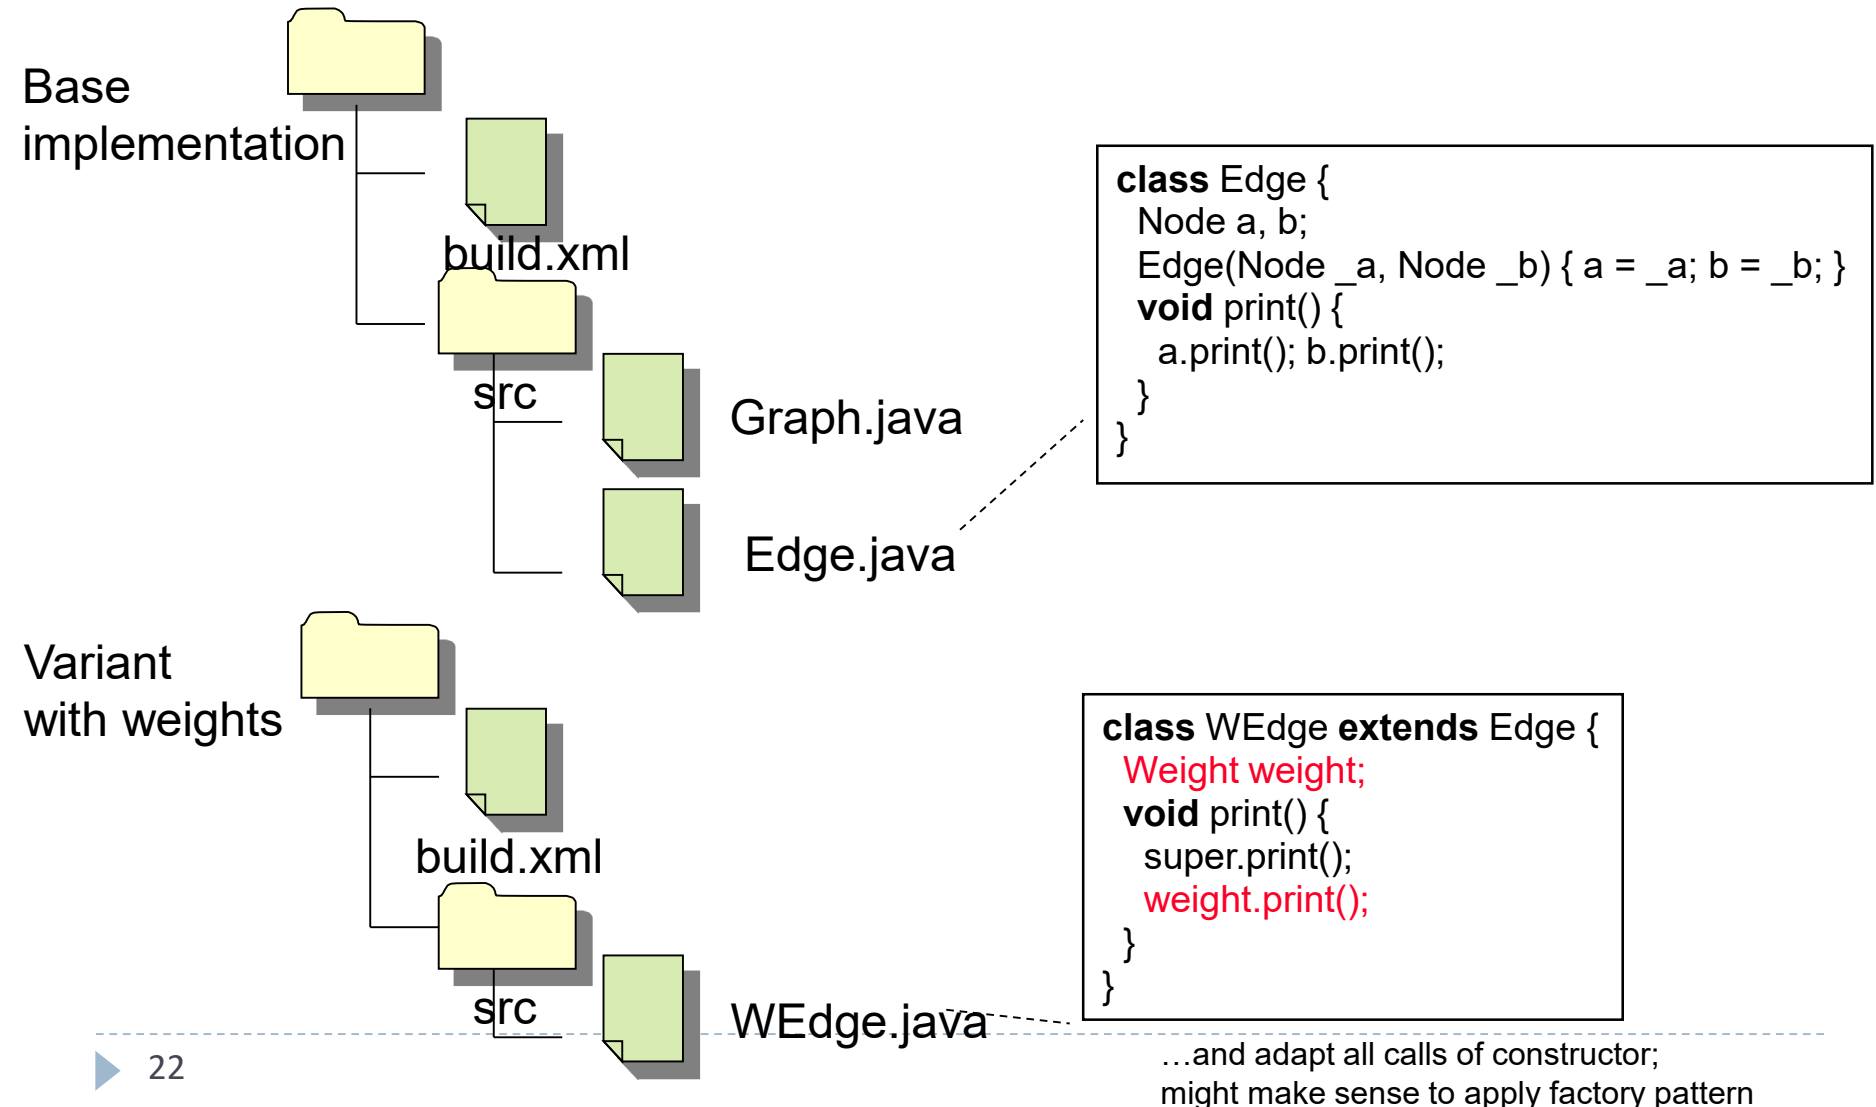

- ▶ Per variant, one config file or build script
- ▶ On compilation, include or exclude files
- ▶ Overwrite files with product-specific variants

Example: graph library

Alternative example: graph library

Solution 3: variability-based build system

- ▶ Example: Linux kernel
- ▶ Linux kernel has its own build system: kbuild
 - ▶ Maintains a hierarchy of >600 build scripts as input for make tool; structured by convention
 - ▶ Many scripts only executed if a particular option active
 - ▶ 97% of >9000 C files of linux kernel are optional

Solution 3: variability-based build system

▶ Typical commands

- ▶ `obj-y += foo.o` Compile **foo.c** and link it to kernel
- ▶ `obj-m += foo.o` Compile **foo.c** as a loadable kernel module
- ▶ `obj-l += foo.o` Compile **foo.c** as a library
- ▶ `obj-(CONFIG_FOO) += foo.o` Proceed with **foo.c** as specified in configuration:
y, m, or n (don't compile)

▶ Additional patterns

- ▶ Group files that belong to the same feature
- ▶ Can set config options for all vs. selected files
- ▶ Complex conditions: Kbuild contains a Turing-complete language

Build script from linux kernel

```
1 #
2 # Makefile for the video capture/playback device drivers.
3 #
4
5 tuner-objs      :=      tuner-core.o
6
7 videodev-objs   :=      v4l2-dev.o v4l2-ioctl.o v4l2-device.o
8
9 obj-$(CONFIG_VIDEO_DEV) += videodev.o v4l2-int-device.o
10 ifeq ($(CONFIG_COMPAT),y)
11     obj-$(CONFIG_VIDEO_DEV) += v4l2-compat-ioctl32.o
12 endif
13
14 obj-$(CONFIG_VIDEO_V4L2_COMMON) += v4l2-common.o
15
16 ifeq ($(CONFIG_VIDEO_V4L1_COMPAT),y)
17     obj-$(CONFIG_VIDEO_DEV) += v4l1-compat.o
18 endif
19
20 obj-$(CONFIG_VIDEO_TUNER) += tuner.o
21 obj-$(CONFIG_VIDEO_TVAUDIO) += tvaudio.o
22 obj-$(CONFIG_VIDEO_TDA7432) += tda7432.o
23 obj-$(CONFIG_VIDEO_TDA9875) += tda9875.o
24
25 ...
26
27 EXTRA_CFLAGS += -Idrivers/media/common/tuners
```

From build script:
drivers/media/video/Makefile

Record 1 of 15

Complete program

Product lines with build systems – discussion

▶ Benefits

- ▶ Relatively simple
- ▶ Very flexible – arbitrary changes per variant
- ▶ Little preparation/preplanning required

▶ Drawbacks

- ▶ Each variant developed separately; higher application engineering effort
- ▶ Changes only at file granularity (can only override whole files)
- ▶ Changing the base variant has many hard-to-foresee consequences

Outlook

- ▶ More compile-time variability mechanisms
 - ▶ more fine-grained changes
 - ▶ develop features instead of variants

Preprocessors

```
class Graph {
    Vector nv = new Vector(); Vector ev = new Vector();
    Edge add(Node n, Node m) {
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        if (Conf.WEIGHTED) e.weight = new Weight();
        return e;
    }
    Edge add(Node n, Node m, Weight w)
        if (!Conf.WEIGHTED) throw RuntimeException();
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        e.weight = w; return e;
    }
    void print() {
        for(int i = 0; i < ev.size(); i++) {
            ((Edge)ev.get(i)).print();
        }
    }
}
```

```
class Color {
    static void setDisplayColor(Color c) { ... }
}
```

```
class Conf {
    public static boolean COLORED = true;
    public static boolean WEIGHTED = false;
}
```

```
class Node {
    int id = 0;
    Color color = new Color();
    void print() {
        if (Conf.COLORED) Color.setDisplayColor(color);
        System.out.print(id);
    }
}
```

```
class Edge {
    Node a, b;
    Color color = new Color();
    Weight weight;
    Edge(Node _a, Node _b) { a = _a; b = _b; }
    void print() {
        if (Conf.COLORED) Color.setDisplayColor(color);
        a.print(); b.print();
        if (!Conf.WEIGHTED) weight.print();
    }
}
```

```
class Weight { void print() { ... } }
```

What's missing?

- ▶ Feature-based planning and variant generation
- ▶ Fine-grained variant generation
- ▶ Make features explicit in source code

Preprocessors

- ▶ Transform the source code before the compiler is executed
- ▶ Expressiveness: from simple `#include` commands and boolean options to complex macro languages and rules
- ▶ Common in many programming languages
 - ▶ C, C++, Fortran, Erlang have a dedicated preprocessor
 - ▶ C#, Visual Basic, D, PL/SQL, Adobe Flex

The C preprocessor *cpp*: Features

- ▶ **File includes: #include**
 - ▶ preprocessor inlines the to-be-included files
 - ▶ used, for example, for header files
- ▶ **Macros: #define, #redefine**
 - ▶ preprocessor replaces every occurrence of the given token by the given token sequence
 - ▶ used for defining compile-time functions and variables
- ▶ **Conditional compilation: #if, #ifdef, #ifndef, #else**
 - ▶ preprocessor removes token sequence before compilation
 - ▶ #if supports evaluation of expressions
 - ▶ #ifdef, #ifndef: check if feature set or unset

#ifdef example from BerkeleyDB

```
static int __rep_queue_filedone(dbenv, rep, rfp)
    DB_ENV *dbenv;
    REP *rep;
    __rep_fileinfo_args *rfp; {
#ifndef HAVE_QUEUE
    COMPQUIET(rep, NULL);
    COMPQUIET(rfp, NULL);
    return (__db_no_queue_am(dbenv));
#else
    db_pgno_t first, last;
    u_int32_t flags;
    int empty, ret, t_ret;
#ifdef DIAGNOSTIC
    DB_MSGBUF mb;
#endif
    // over 100 lines of additional code
}
#endif
```

Variability with cpp: typical patterns

```
1 #ifdef FEAT_BIGINT
2     #define SIZE 64
3 #else
4     #define SIZE 32
5 #endif
6
7 ... allocate(SIZE) ...;
```

Alternative macro definitions

```
1 #ifdef FEAT_SELINUX
2     #define FEAT_LINUX 1
3     #undef FEAT_WINDOWS
4 #endif
5
6 #ifdef FEAT_WINDOWS
7 ...
```

Conditional feature definitions

```
1 #ifdef FEAT_WINDOWS
2     #include <windows.h>
3 #else
4     #include <unix.h>
5 #endif
6
7 ... fopen(...) ...;
```

Alternative Includes

```
1 #ifdef FEAT_RAND
2 int rand() { ... }
3 #else
4 #define rand(...) 0
5 #endif
6
7 int i = 3 + rand();
```

Alternative function definitions

Preprocessor in Java?

- ▶ Not natively available
- ▶ Conditional compilation possible in some cases (as a compiler optimisation); only statement level

```
class Example {  
    public static final boolean DEBUG = false;  
  
    void main() {  
        System.out.println("always");  
        if (DEBUG)  
            System.out.println("debug info");  
    }  
}
```

- ▶ External tools, e.g. CPP, Antenna, Munge, XVCL, Gears, pure::variants

Munge

- ▶ Simple preprocessor for Java
- ▶ Originally for Swing in Java 1.2

```
class Example {  
void main() {  
    System.out.println("imмер");  
    /*if[DEBUG]*/  
    System.out.println("debug info");  
    /*end[DEBUG]*/  
}  
}
```

java Munge **-DDEBUG -DFEATURE2** File1.java File2.java ... target-directory

feature selection according to feature model

Refresher: graph example

```
class Graph {
    Vector nv = new Vector(); Vector ev = new Vector();
    Edge add(Node n, Node m) {
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        e.weight = new Weight();
        return e;
    }
    Edge add(Node n, Node m, Weight w)
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        e.weight = w; return e;
    }
    void print() {
        for(int i = 0; i < ev.size(); i++) {
            ((Edge)ev.get(i)).print();
        }
    }
}
```

```
class Node {
    int id = 0;
    Color color = new Color();
    void print() {
        Color.setDisplayColor(color);
        System.out.print(id);
    }
}
```

```
class Edge {
    Node a, b;
    Color color = new Color();
    Weight weight; = new Weight();
    Edge(Node _a, Node _b) { a = _a; b = _b; }
    void print() {
        Color.setDisplayColor(color);
        a.print(); b.print();
        weight.print();
    }
}
```

```
class Color {
    static void setDisplayColor(Color c) { ... }
}
```

```
class Weight { void print() { ... } }
```

Graph example with Munge

```
class Graph {
    Vector nv = new Vector(); Vector ev = new Vector();
    Edge add(Node n, Node m) {
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        /*if[WEIGHT]*/
        e.weight = new Weight();
        /*end[WEIGHT]*/
        return e;
    }
    /*if[WEIGHT]*/
    Edge add(Node n, Node m, Weight w)
        Edge e = new Edge(n, m);
        nv.add(n); nv.add(m); ev.add(e);
        e.weight = w; return e;
    }
    /*end[WEIGHT]*/
    void print() {
        for(int i = 0; i < ev.size(); i++) {
            ((Edge)ev.get(i)).print();
        }
    }
}
```

```
/*if[WEIGHT]*/
class Weight { void print() { ... } }
/*end[WEIGHT]*/
```

```
class Edge {
    Node a, b;
    /*if[COLOR]*/
    Color color = new Color();
    /*end[COLOR]*/
    /*if[WEIGHT]*/
    Weight weight;
    /*end[WEIGHT]*/
    Edge(Node _a, Node _b) { a = _a; b = _b; }
    void print() {
        /*if[COLOR]*/
        Color.setDisplayColor(color);
        /*end[COLOR]*/
        a.print(); b.print();
        /*if[WEIGHT]*/
        weight.print();
        /*end[WEIGHT]*/
    }
}
```

```
/*if[COLOR]*/
class Color {
    static void setDisplayColor(Color c) { ... }
}
/*end[COLOR]*/
```

```
class Node {
    int id = 0;
    /*if[COLOR]*/
```

► Tagging of „functional blocks“

Patrick Heymans, Quentin Boucher, Andreas Classen, Arnaud Bourdoux, Laurent Demonceau: A code tagging approach to software product line development - An application to satellite communication libraries. STTT 14(5): 553-566 (2012)

Discussion

Benefits

- ▶ **Widely used**
 - ▶ Contained in many language, tool support available
 - ▶ Familiar to developers who know these languages
- ▶ **Simple**
 - ▶ Very simple programming concept:
mark and remove
 - ▶ Very flexible, expressive, fine-grained
- ▶ **No preparation/preplanning necessary**
 - ▶ Easy to introduce into existing project

Main problem: code readability

- ▶ Mixes two languages (C and #ifdefs, or Java and Munge, ...)
- ▶ Understanding of control flow complicated
- ▶ Long annotated code blocks: beginning and end hard to find
- ▶ Additional line breaks corrupt layout

➔ Modularity as alternative?

```
class Stack {  
    void push(Object o  
    #ifdef SYNC  
        , Transaction txn  
    #endif  
    ) {  
        if (o==null  
    #ifdef SYNC  
            || txn==null  
    #endif  
        ) return;  
    #ifdef SYNC  
        Lock l=txn.lock(o);  
    #endif  
        elementData[size++] = o;  
    #ifdef SYNC  
        l.unlock();  
    #endif  
        fireStackChanged();  
    }  
}
```

Further problems

- ▶ Complexity due to arbitrarily deep nesting
- ▶ Especially error-prone when used in complex code constructs, uncontrolled/undisciplined use
- ▶ Examples:
 - ▶ Variable return type

```
/*if[WEIGHT]*W/*end[WEIGHT]*Edge add(Node n, Node m /*if[WEIGHT]*/, int w/*end[WEIGHT]*) {  
    return new /*if[WEIGHT]*W/*end[WEIGHT]*Edge (n, m /*if[WEIGHT]*/, w/*end[WEIGHT]*);  
}
```

- ▶ Commas between multiple parameters

```
Edge set(/*if[WEIGHT]*int w/*if[COLOR]*/, /*end[COLOR]*/*end[WEIGHT]*/*if[COLOR]*int c/*end[COLOR]*/) {  
    ...  
}
```

Problem: error-prone

► Syntax errors

```
static int _rep_queue_filedone(...)
    DB_ENV *dbenv;
    REP *rep;
    __rep_fileinfo_args *rfp; {
#ifdef HAVE_QUEUE
    COMPQUIET(rep, NULL);
    COMPQUIET(rfp, NULL);
    return (__db_no_queue_am(dbenv));
#else
    db_pgno_t first, last;
    u_int32_t flags;
    int empty, ret, t_ret;
#endif DIAGNOSTIC
    DB_MSGBUF mb;
#endif
//over 100 lines of additional code
}
#endif
```

► Type errors

```
#ifdef TABLES
class Table {
    void insert(Object data,
                Txn txn) {
        storage.set(data,
                    txn.getLock());
    }
}
#endif
class Storage {
#ifdef WRITE
    boolean set(...) { ... }
#endif
}
```

Additional problems

- ▶ Feature core is spread throughout entire program
 - ▶ ➔ *feature traceability problem*
 - ▶ How to find a bug in feature *Weight*?
- ▶ Tool support becomes much more complicated
 - ▶ Experience from C/C++ (refactoring, analysis, ...)
 - ▶ Munge and others: definitions in comments

Preprocessor in Femto OS

Feature traceability problem

Problem: implementation scattered

- ▶ Features vanish in implementation
 - ▶ What belongs to a feature?
 - ▶ Maintaining the feature might require to find all relevant code parts
- ▶ Collaboration is made more complicated
 - ▶ Experts for different features might have to work on same code files at the same time
- ▶ Roadblock to productivity and efficient evolution
 - ▶ When adding new functionality, developer has to think about other concerns that are not directly relevant for the task at hand (readability, understandability)

Features in graph example

Consequences

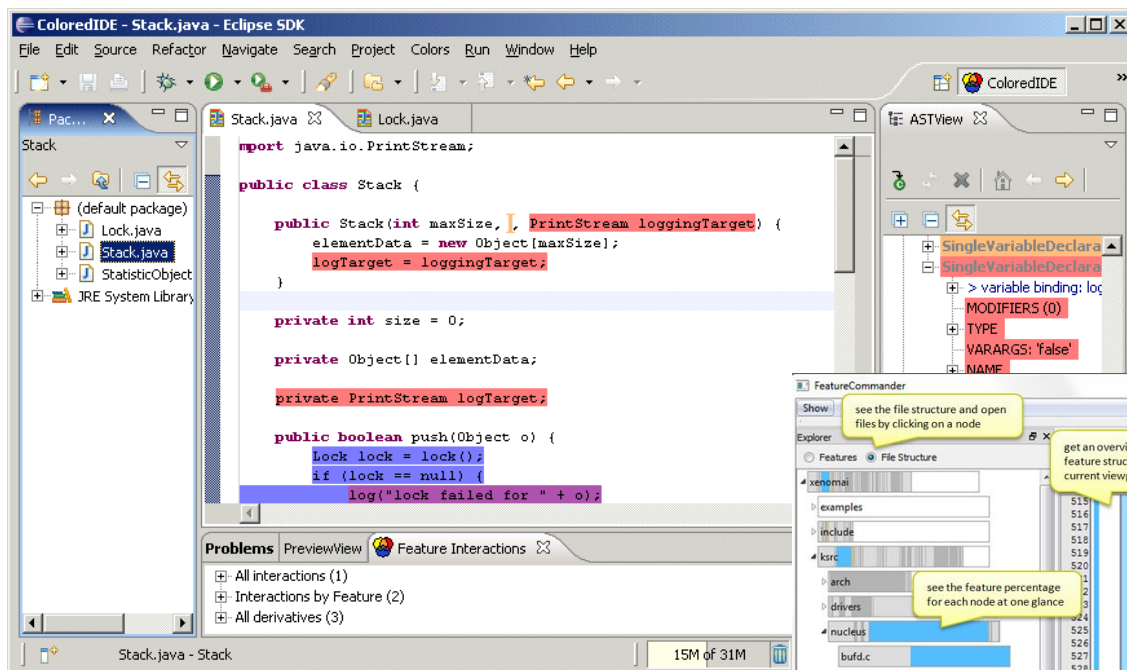

```
class BusinessClass
//... data fields
//... logging stream
//... cache status
public void importantOperation(
    Data data, User currentUser, ...){
    // check authorization
    // lock objects for synchronization
    // check if puffer up-to-date
    // log start of actual operation
    // execute actual operation
    // log end of actual operation
    // unlock objects
}
public void alsoImportantOperation(
    OtherData data, User currentUser, ...){
    // check authorization
    // lock objects for synchronization
    // check if puffer up-to-date
    // log start of actual operation
    // execute actual operation
    // log end of actual operation
    // unlock objects
}
}
```

- ▶ Which code belongs to authentication?
- ▶ When locking procedure is to be changed: which parts have to be touched?
- ▶ A user could delete files without being logged in: where to search for error?

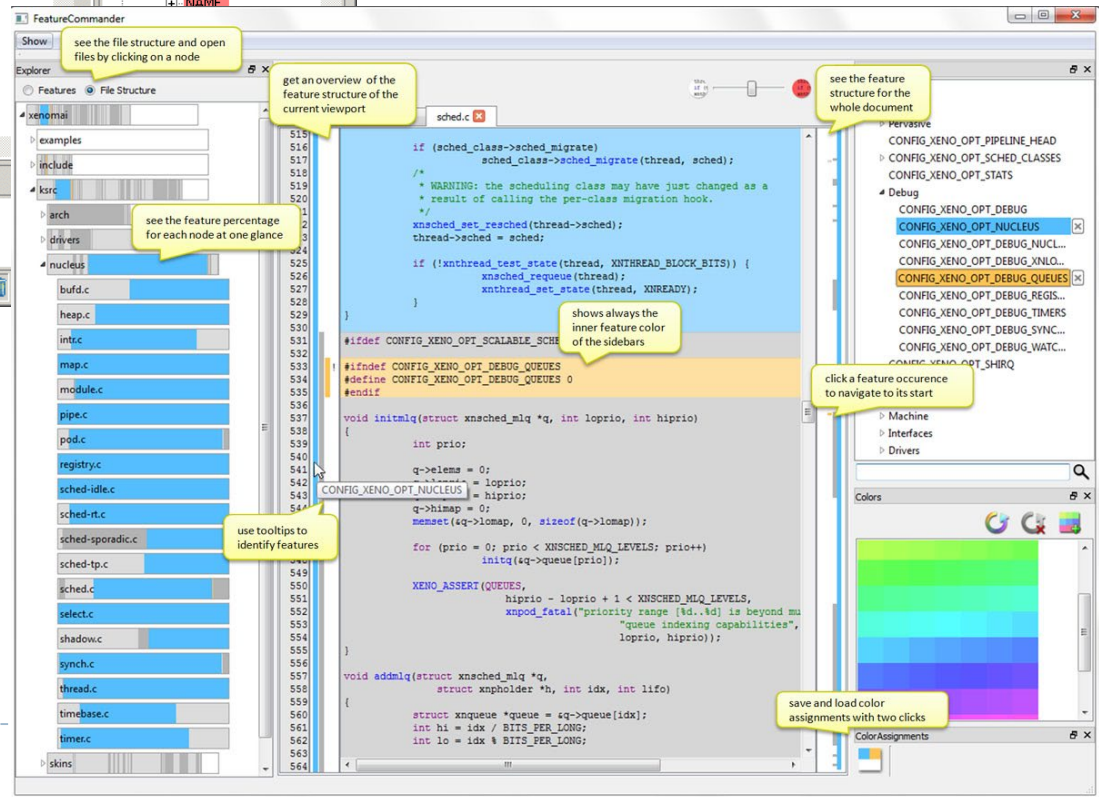

Feature traceability

- ▶ Want to keep feature-to-code connection
- ▶ Ideally, a module per feature
- ▶ Need to resort to workarounds and makeshift solutions if modularization not possible
 - ▶ Comments or annotations in source code (e.g., all code relevant for authentication marked with „//auth“)
 - ▶ Naming conventions (e.g., all authentication-related methods start with „auth_“)
 - ▶ Additional tools, e.g., as part of IDE
- ▶ Preprocessors already offer annotations
 - ▶ But usually only optional features

CIDE

FeatureCommander

<http://fossd.net/cide/>
<http://fossd.net/fc/>

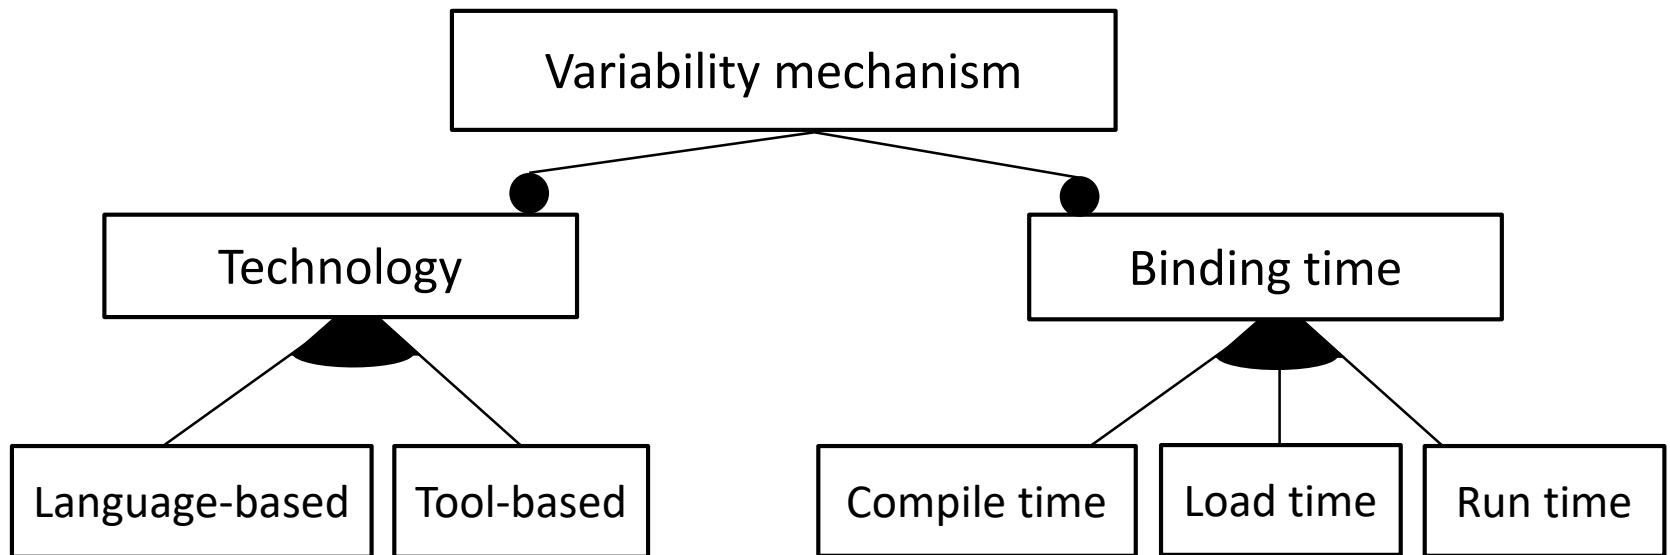

Outlook

- ▶ Feature implementation in modular way
- ▶ Dealing with cross-cutting concerns
- ▶ Possible improvements of preprocessor

Literature

- ▶ M. Staples, D. Hill. Experiences adopting software product line development without a product line architecture. Proceedings APSEC, pp. 176—183, 2004

- ▶ T. Dhaliwal, F. Khomh, Y. Zou, A. Hassan. Recovering commit dependencies for selective code integration in software product lines. Proceedings ICSM, 202—211, 2012
[Mapping of commits to features; dependency analysis]

Zoom quiz: versioning systems, build systems?

Zoom quiz

- ▶ How many source code variants are possible?

```
int a = 1;
#ifdef A
int c = a;
#endif
if (c) {
    c += a;
#ifdef A && B
    c /= a;
#endif
}
```

Zoom quiz

► Where is the bug?

(a)

```
int a = 1;
int b = 1;
#ifdef A
int c = a;
#else
char c = a;
#endif
if (c) {
    c += a;
#ifdef B
    c /= b;
}
#endif
```

(b)

```
int a = 1;
int b = 1;
#ifdef A
int c = a;
#else
char d = a;
#endif
if (c) {
    c += a;
#ifdef B
    c /= b;
#endif
}
```

(c)

```
int a = 1;
int b = 0;
#ifdef A
int c = a;
#else
char c = a;
#endif
if (c) {
    c += a;
#ifdef B
    c /= b;
#endif
}
```
